

Patent Abstracts of Japan

TITLE : INFORMATION MEDIUM

CONSTITUTION: The label 2 indicating that the signal is recorded in the disc tilt correcting system is put on both sides of the disc 1. With the label 2, in recording/reproducing a signal on the disc 1, switches or the like are set to activate the disc tilt correcting circuit at disc loading. When it is required to reproduce an address signal 3 or the like recorded in advance on the disc, the address signal 3 is compared with a gate signal 4 to detect a reflected light 2 of a mirror part representing the disc tilt correction system. The disc tilt correction circuit in the recording/reproducing circuit is activated by the presence of the reflected light 2.
